

ABSTRACT OF THE DISCLOSURE

Packaging for cosmetic products, typically including a case having a cover provided with a first hinge portion, a recessed bottom possibly including an intermediate support fixed to the said bottom and a receptacle in which the cosmetic products will be placed, the bottom or the mesh being provided with a second hinge portion, a hinge with an axis of rotation R formed by cooperation between the first and second portions of the hinge, a means of locking and unlocking the said cover with respect to the bottom or mesh, typically a clasp, and if possible an applicator for the cosmetic product. The packaging has a driving means to at least partially open the cover, and an opposing braking means, the driving means and braking means respectively applying a driving torque  $C_M = M(\alpha)$  and a braking torque  $C_F = F(\alpha)$  on the cover in opposite directions and with a predetermined force depending on the opening angle  $\alpha$  of the cover. The driving means and the braking means cooperate with the first hinge portion and second hinge portion.
